

(a) Sliding-window extraction

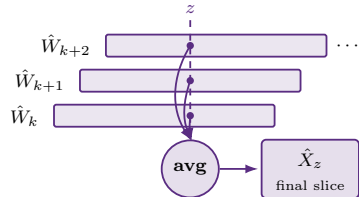

(b) Shared-weight inference

Shared weights $\hat{\theta}$ applied independently to *every* overlapping window position k

(c) Overlap accumulation at slice z

$$\mathcal{K}_z = \{k : k \leq z < k+26\}$$

$$\hat{X}_z = \frac{1}{|\mathcal{K}_z|} \sum_{k \in \mathcal{K}_z} \hat{W}_k[z - k]$$

pre-harmonization window (input, W_k)

post-harmonization window (harmonized, $\hat{W}_k$)

(d) Number of overlapping predictions per global slice, $|\mathcal{K}_z|$
